3 DRAFT WORKING DOCUMENT FOR COMMENTS:
4

5 WHO good manufacturing practices
6 for investigational products
7
8

Please send your comments to **Dr Steve Estevão Cordeiro**, Technical Officer, WHO Norms and Standards for Pharmaceuticals, Technical Standards and Specifications (estevaos@who.int), with a copy to Ms Sinead Jones (jnessi@who.int) before **31 August 2021**. Please use the "Table of Comments" attached to this email for this purpose.

Our working documents are sent out electronically and they will also be placed on the WHO Medicines website (<https://www.who.int/teams/health-product-and-policy-standards/standards-and-specifications/pharmaceuticals/current-projects>) for comments under the "Working documents in public consultation" link. If you wish to receive all our draft guidelines, please send your email address to jnessi@who.int and your name will be added to our electronic mailing list.

16 This is a draft. The content of this document is not final, and the text may be subject to revisions before publication. The
17 document may not be reviewed, abstracted, quoted, reproduced, transmitted, distributed, translated or adapted, in part or
18 in whole, in any form or by any means without the permission of the World Health Organization.
19

20 Please send any request for permission to: Ms Sinéad Jones, Norms and Standards for Pharmaceuticals, Technical Standards
21 and Specifications, Department of Health Products Policy and Standards, World Health Organization, CH-1211 Geneva 27,
22 Switzerland, email: jnessi@who.int.
23

24 The designations employed and the presentation of the material in this draft do not imply the expression of any opinion
25 whatsoever on the part of the World Health Organization concerning the legal status of any country, territory, city or area or
26 of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted lines on maps represent approximate
27 border lines for which there may not yet be full agreement.
28

29 The mention of specific companies or of certain manufacturers' products does not imply that they are endorsed or
30 recommended by the World Health Organization in preference to others of a similar nature that are not mentioned. Errors
31 and omissions excepted, the names of proprietary products are distinguished by initial capital letters.
32

33 All reasonable precautions have been taken by the World Health Organization to verify the information contained in this draft.
34

35 However, the printed material is being distributed without warranty of any kind, either expressed or implied. The responsibility
36 for the interpretation and use of the material lies with the reader. In no event shall the World Health Organization be liable
37 for damages arising from its use.
38

39 This draft does not necessarily represent the decisions or the stated policy of the World Health Organization.

41

SCHEDULE FOR DRAFT WORKING DOCUMENT QAS/20.863:

42

WHO good manufacturing practices

43

for investigational products

Description of Activity	Date
Following a recommendation by the Fifty-fifth Expert Committee on Specifications for Pharmaceutical Preparations (ECSPP), the WHO Secretariat was recommended to revise the existing guideline on good manufacturing practices for investigational products.	October 2020
Preparation of first draft working document.	October 2020
Mailing of working document to the Expert Advisory Panel on the International Pharmacopoeia and Pharmaceutical Preparations (EAP) inviting comments and posting of the working document on the WHO website for public consultation	November 2020
Consolidation of comments received and review of feedback. Preparation of working document for discussion.	January 2021
Discussion of the feedback received on the working document in a virtual meeting with an expert working group	February-March 2021
Preparation of working document for next round of public consultation.	March 2021
Mailing of revised working document inviting comments, including to the EAP, and posting the working document on the WHO website for a second round of public consultation.	April 2021
Consolidation of comments received and review of feedback. Preparation of working document for discussion.	June 2021
Discussion of comments in the virtual meeting on <i>Good practices for health product manufacture and inspection</i>	28 June - 2 July 2021
Preparation of working document for next round of public consultation.	July 2021
Mailing of revised working document inviting comments, including to the EAP, and posting the working document on the WHO website for a second round of public consultation.	July – August 2021
Consolidation of comments received and review of feedback. Preparation of working document for discussion in the ECSPP.	September – October 2021

Presentation to the Fifty-sixth meeting of the ECSPP.	TBD
Any other follow-up action as required.	

44

45

DRAFT FOR COMMENTS

46 WHO good manufacturing practices for 47 investigational products 48 49

50 **Background**

51
52 In view of an old publication date, and the recent need for new guidelines arising from inspections
53 carried out for COVID-19 therapeutics, the World Health Organization (WHO) Prequalification Team -
54 Inspection Services (PQT INS) raised the urgency for a revision of the *WHO Good manufacturing*
55 *practices for investigational pharmaceutical products for clinical trials in humans* (1). The Fifty-fifth
56 Expert Committee on Specifications for Pharmaceutical Preparations (ECSP) concurred with this
57 proposal.

58
59 The objective of this update is to bring the guideline in line with current expectations and trends in
60 good practices and to harmonize the text with the principles from other related international
61 guidelines.

DRAFT FOR COMMENTS

99 **1. Introduction**

100

101 1.1. Investigational products are used for testing purposes; as a reference in clinical trials and field
102 trials; as a placebo; for an unauthorized indication; and to gain further information about the
103 authorized form.

104

105 1.2. In some cases, marketed products which have been re-packaged or modified in some way, are
106 used for investigational purposes.

107

108 1.3. The legal status of investigational products varies from country to country.

109

110 1.4. These products are sometimes not covered by legal and regulatory provisions in the areas
111 of good practices (GxP) and inspection. These complexities, such as lack of high level good
112 manufacturing practices (GMP) requirements, risk of contamination and cross-
113 contamination, clinical trial designs, blinding and randomization, increase the risk related
114 to the investigational product. In addition, there are also instances where there is
115 incomplete knowledge of the potency and safety of the investigational product.

116

117 1.5. There are further risks associated with the production, validation, testing, control, shipping,
118 storage and use of investigational products.

119

120 1.6. To minimize risk; to ensure the safety of the subjects participating in clinical trials; and to ensure
121 that the results of clinical trials are unaffected by inadequate safety, quality or efficacy arising
122 from unsatisfactory manufacture, investigational products should be manufactured and
123 managed in accordance with an effective quality management system and the
124 recommendations contained in this guideline.

125

126 1.7. Other guidelines and GxP should be taken into account, where relevant and as appropriate, as
127 to the stages of development, production and control of the product.

128

129 1.8. In accordance with the quality management system, provision should be made for changes
130 whenever necessary, as knowledge of the process increases over time, and in accordance with
131 the stages of development of the product.

- 132 1.9. Investigational products should be manufactured in a manner:
- 133 • that is compliant to GxP, as appropriate to the stage of development;
 - 134 • that ensures that subjects of clinical trials will be protected from poor quality
135 products due to unsatisfactory manufacturing;
 - 136 • to assure consistency between and within batches of the investigational product;
137 and
 - 138 • that allows for the review of the data from the investigational products used against
139 the future commercial product.
- 140
- 141 1.10. The selection of an appropriate dosage form for clinical trials is important. While it is
142 accepted that the dosage form may be very different from the anticipated final formulation
143 (e.g. a capsule instead of a tablet) in early trials, in the pivotal Phase III studies, it should be
144 similar to the projected commercial presentation; otherwise these trials will not necessarily
145 prove that the marketed product is both efficacious and safe. If there are differences between
146 the clinical and commercial dosage forms, scientific justification and data should be submitted
147 to the registration authorities to demonstrate that the final dosage form is equivalent, in terms
148 of bioavailability and stability, to that used in the clinical trials.
- 149
- 150 1.11. The quality control of investigational products should be appropriate to the stage of
151 development. For example, dosage forms in Phase III clinical studies should be characterized
152 and assured at a similar level, as for commercially manufactured products.
- 153
- 154 1.12. Where production and/or quality control is transferred from one site to another, the
155 recommendations in the guideline for transfer of technology should be followed (2).
- 156
- 157 1.13. This document should be read in conjunction with other WHO GxP guidelines. See section
158 References (1-11).
- 159

160 **2. Scope**

161

- 162 2.1. The recommendations in this guideline are mainly applicable to investigational products for
163 human use.

164 2.2. The principles in this guideline should be considered in early phase clinical manufacture.

165

166 2.3. Some of the principles may be applied to other investigational products.

167

168 **3. Glossary**

169

170 The definitions given below apply to the terms used in this guideline. They may have different meanings
171 in other contexts.

172

173 **clinical trial.** Any systematic study on pharmaceutical products in human subjects, whether in patients
174 or other volunteers, in order to discover or verify the effects of, and/or identify any adverse reaction
175 to, investigational products, and/or to study the absorption, distribution, metabolism and excretion of
176 the products with the object of ascertaining their efficacy and safety.

177

178 Clinical trials are generally divided into Phases I-IV. It is not possible to draw clear distinctions between
179 these phases, and different opinions about details and methodology do exist. However, the individual
180 phases, based on their purposes as related to the clinical development of pharmaceutical products, can
181 be briefly defined as follows:

182 ➤ **Phase I.** These are the first trials of a new active ingredient or new formulations in humans,
183 often carried out in healthy volunteers. Their purpose is to make a preliminary evaluation of
184 safety, and an initial pharmacokinetic/pharmacodynamic profile of the active ingredient.

185 ➤ **Phase II.** The purpose of these therapeutic pilot studies is to determine activity and to assess
186 the short-term safety of the active ingredient in patients suffering from a disease or condition
187 for which it is intended. The trials are performed in a limited number of subjects and are
188 often, at a later stage, of a comparative (e.g. placebo-controlled) design. This phase is also
189 concerned with the determination of appropriate dose ranges/regimens and (if possible) the
190 clarification of dose-response relationships in order to provide an optimal background for the
191 design of extensive therapeutic trials.

192 ➤ **Phase III:** This phase involves trials in large (and possibly varied) patient groups for the purpose
193 of determining the short- and long-term safety-efficacy balance of formulation(s) of the
194 active ingredient, and assessing its overall and relative therapeutic value. The pattern and
195 profile of any frequent adverse reactions must be investigated and special features of the
196 product must be explored (e.g. clinically relevant drug interactions, factors leading to

197 differences in effect, such as age). The trials should preferably be randomized double-blind
198 but other designs may be acceptable for example,. long-term safety studies. In general,
199 the conditions under which the trials are conducted should be as close as possible to the
200 normal conditions of use.

201 ➤ **Phase IV.** In this phase, studies are performed after the pharmaceutical product has been
202 marketed. They are based on the product characteristics on which the marketing
203 authorization was granted and normally take the form of post-marketing surveillance and
204 assessment of therapeutic value or treatment strategies. Although methods may differ,
205 the same scientific and ethical standards should apply to Phase IV studies as are applied in
206 premarketing studies. After a product has been placed on the market, clinical trials
207 designed to explore new indications, new methods of administration or new
208 combinations, and so on, are normally regarded as trials of new pharmaceutical products.

209
210 **expiry date.** The date placed on the container/label of an investigational medicinal product
211 designating the time during which the investigational medicinal product is expected to remain
212 within established shelf life specifications if stored under defined conditions, and after which it
213 should not be used.

214
215 **investigational product.** Any pharmaceutical product including a new product, existing product
216 for a new indication, reference product or placebo being tested or used as a reference in a clinical
217 trial.

218
219 **investigator.** The person responsible for the trial and for protecting the rights, health and welfare
220 of the subjects in the trial. The investigator must be an appropriately qualified person, legally
221 allowed to practice medicine/dentistry.

222
223 **monitor.** A person appointed by, and responsible to, the sponsor for monitoring and reporting the
224 progress of the trial and for the verification of data.

225
226 **order.** An instruction to process, package and/or ship a certain number of units of an
227 investigational product.

228

229 **pharmaceutical product.** For the purpose of this document, this term is defined in the same way
230 as in the WHO guidelines on GCP (4), i.e. as any substance or combination of substances which
231 has a therapeutic, prophylactic or diagnostic purpose, or is intended to modify physiological
232 functions, and is presented in a dosage form suitable for administration to humans.

233

234 **product specification file(s).** The Product specification file brings together and contains all of the
235 essential reference documents to ensure that investigational medicinal products are manufactured
236 according to good manufacturing practice for investigational medicinal products and the clinical trial
237 authorisation. It should be continually updated as development of the product proceeds, ensuring
238 appropriate traceability to the previous versions.

239

240 **protocol.** A document which gives the background, rationale and objectives of the trial and describes
241 its design, methodology and organization, including statistical considerations and the conditions under
242 which it is to be performed and managed. It should be dated and signed by the investigator/institution
243 involved and the sponsor, and can, in addition, function as a contract.

244

245 **reference sample.** A sample of a batch of starting material, packaging material, product contained in
246 its primary packaging or finished product which is stored for the purpose of being analysed, should the
247 need arise.

248

249 **retention sample.** A sample of a packaged unit from a batch of finished product for each packaging
250 run/trial period. It is stored for identification purposes: for example, presentation, packaging, labelling,
251 leaflet, batch number and expiry date, should the need arise.

252

253 **shipping/dispatch.** The assembly, packing for shipment and sending of ordered medicinal products for
254 clinical trials.

255

256 **sponsor.** An individual, company, institution or organization which takes responsibility for the
257 initiation, management and/or financing of a clinical trial. When an investigator independently initiates
258 and takes full responsibility for a trial, the investigator also then assumes the role of the sponsor.

259

260

261 **4. Quality management**

262

263 4.1. There should be a comprehensively designed, clearly defined, documented and correctly
264 implemented quality management system in place. Senior management should assume
265 responsibility for this as well as the quality of the investigational product.

266

267 4.2. All parts of the quality system should be adequately resourced and maintained.

268

269 4.3. The quality system should incorporate GMP which would be applied appropriately to the stages
270 of the development, including the technology transfer and the interface (e.g. shipment,
271 storage, labelling) between the manufacture and the trial site.

272

273 4.4. The quality management system should ensure that:

274 • products are designed and developed in accordance with the requirements of this
275 document and other associated guidelines such as good laboratory practice (GLP) (3),
276 good clinical practice (GCP) (4), good manufacturing practices (GMP) (5, 6) and good
277 storage and distribution practices (GSDP) (7), where appropriate;

278 • responsibilities are clearly defined in job descriptions;

279 • operations are clearly described in a written form;

280 • arrangements are made for the manufacture, supply and use of the correct starting
281 and packaging materials;

282 • all necessary controls on starting materials, intermediate products, bulk products and
283 other in-process controls should be in place;

284 • maintenance, calibrations and validations are carried out where necessary;

285 • the finished product is correctly processed and checked according to the defined
286 procedures;

287 • changes are appropriately managed;

288 • deviations are investigated and recorded with an appropriate level of root cause
289 analysis done and appropriate corrective actions and/or preventive actions (CAPAs)
290 identified and taken; and

291 • investigational products are stored, distributed and subsequently handled in
292 accordance with relevant good practices guidelines.

293 **5. Quality risk management**

294

295 5.1. There should be a system for quality risk management (8).

296

297 5.2. The system for quality risk management should cover a systematic process for the assessment,
298 control, communication and review of risks to the quality of the product and, ultimately, to the
299 protection of the trial subject and patient.

300

301 5.3. The quality risk management system should ensure that:

- 302 • the evaluation of the risk is based on scientific knowledge and experience with the
303 process and product;
- 304 • procedures and records for quality risk management are retained; and
- 305 • the level of effort, formality and documentation of the quality risk management
306 process is commensurate with the level of risk.

307

308 5.4. Quality risk management should be applied both prospectively and retrospectively, as
309 appropriate.

310

311 **6. Personnel**

312

313 6.1. There should be a sufficient number of appropriately qualified personnel available to carry out
314 all the tasks for which the manufacturer of investigational products is responsible.

315

316 6.2. Individual responsibilities should be clearly defined, recorded as written descriptions and
317 understood by the persons concerned.

318

319 6.3. A designated person, with a broad knowledge of product development and clinical trial
320 processes should ensure that there are systems in place that meet the requirements of this
321 guideline and other relevant GxP guidelines.

322

323 6.4. Personnel involved in the development, production and control of investigational products
324 should have appropriate qualifications. They should be trained in relevant GxP and the

325 requirements specific to investigational products. Records should be maintained.

326

327 6.5. Persons responsible for production and quality should be clearly identified and
328 independent, one from the other where applicable.

329

330 6.6. A responsible person should be designated for the release of batches.

331

332 6.7. Appropriate protective garments should be worn, based on operations and risk.

333

334 6.8. Smoking, eating, drinking, chewing and keeping plants, food, drink, smoking material and
335 personal medicines should not be permitted in any area where they might adversely influence
336 product quality.

337

338 6.9. Visitors and untrained persons should only be allowed into production and quality control areas
339 as a rare exception and should then be instructed and closely supervised at all times.

340

341 **7. Documentation**

342

343 7.1. Good documentation is an essential part of a quality management system. Documents should
344 be appropriately designed, prepared, reviewed and distributed. They should also be
345 appropriate for their intended use.

346

347 7.2. Documents should be approved, signed and dated by the appropriate responsible persons. No
348 authorized document should be changed without the prior authorization and approval.

349

350 *Specifications*

351

352 7.3. Specifications with limits for impurities where applicable should be available; for example, raw
353 materials, starting materials, placebo, intermediate, bulk and finished products. There should
354 be specifications for primary packaging materials.

355

356 7.4. In developing specifications, attention should be paid to the characteristics which affect
357 the efficacy and safety of products, namely:

- 358 • the assay of the therapeutic or unitary dose (content uniformity can be used for
359 quantitation of drug product assay or unitary dose);
- 360 • the release of active ingredients from the dosage form: dissolution time, etc.;
- 361 • the package size should be suitable for the requirements of the trial, where
362 applicable;
- 363 • the estimated stability, if necessary, under accelerated conditions; and
- 364 • the preliminary storage conditions and the shelf life of the product.

365
366 7.5. As a result of new experience in the development of an investigational product, specifications
367 may be changed by following a documented procedure. Changes should be authorized by a
368 responsible person. Each new version should take into account the latest data and
369 information, current technology, regulatory and pharmacopoeia requirements. There should
370 be traceability of the previous version(s). The reasons for changes should be recorded. The
371 impact of the change on any on-going clinical trials, on product quality, stability, bio-availability,
372 and bio equivalence (where applicable) should be considered based on risk.

373
374 *Order*

375
376 7.6. An order should be available for the request of a certain number of units for processing,
377 packaging, storage and their shipping.

378
379 7.7. The order should be given by or on behalf of the sponsor to the manufacturer of an
380 investigational product.

381
382 7.8. The order should be in writing (e.g. by paper or electronic means, or a combination
383 thereof), be authorized and contain sufficient detail including reference to the approved
384 product specification file (see below) and the relevant clinical trial protocol, as appropriate.

385
386 7.9. Where commercially available products are obtained to be used as reference products,
387 such as for use in bio-equivalence studies, the relevant documentation, such as a purchase
388 order, an invoice, storage and transport records, should be maintained and available for
389 inspection.

390

391 *Product specification file(s)*

392

393 7.10. A product specification file (or files) should contain, or refer to files containing all the
394 information necessary to prepare detailed written instructions on processing, packaging,
395 quality control testing, batch release, storage conditions and/or shipping.

396

397 7.11. The information should form the basis for assessment of the suitability for certification and
398 release of a particular batch by the designated responsible person. It should include or refer
399 to the following documents:

- 400 • specifications for starting materials, packaging materials, intermediate and finished
401 product;
- 402 • analytical procedures for starting materials, packaging materials, intermediate and
403 finished product;
- 404 • manufacturing methods;
- 405 • in-process testing and methods;
- 406 • approved label;
- 407 • relevant clinical trial protocols;
- 408 • randomization codes, as appropriate;
- 409 • relevant technical agreements, as appropriate;
- 410 • stability data; and
- 411 • storage and distribution conditions.

412

413 *Note:* The contents will vary depending on the product and stage of development. Where different
414 manufacturing steps are carried out at different locations, it is acceptable to maintain separate files
415 limited to information of relevance to the activities at the respective locations.

416

417 *Manufacturing formulae and processing instructions*

418

419 7.12. Every manufacturing operation or supply should have clear written instructions for personnel,
420 based on the relevant product specification file and trial details, and written records to enable
421 the details of activities to be reconstructed .

422

423 7.13. As a result of new experience in the development of an investigational product, manufacturing

424 formulae and processing instructions may be changed by following a documented procedure.
425 Each new version should take into account the latest data and information, current technology,
426 regulatory and other requirements. There should be traceability to previous versions. The
427 reasons for changes should be recorded. The impact of the change on any on-going clinical
428 trial, product quality, stability, bio-availability and bio equivalence (where applicable) should be
429 considered based on risk. Changes should be authorized by a responsible person.

430
431 7.14. Batch processing and packaging records as well as product specification files should be retained
432 for at least five years after the termination or discontinuance of the clinical trial, or after the
433 registration of the investigational product.

434
435 7.15. Where the data are intended for inclusion in an application for product registration (marketing
436 authorization) purposes, the records should be maintained for 25 years from authorization or
437 until the end of the life cycle of the product, whichever is shorter.

438
439 *Packaging instructions*

440
441 7.16. The theoretical number of units to be packaged should be specified before the start of the
442 packaging operation. This should include the number of units necessary for carrying out quality
443 controls and the number of samples from each batch used in the clinical trial to be kept as
444 retention samples. Reconciliation should be carried out at defined intervals, where required,
445 and at the end of the packaging and labelling process.

446
447 7.17. Investigational products should normally be packed individually for each subject included in the
448 clinical trial.

449
450 *Labelling instructions*

451
452 7.18. Investigational products should be labelled in accordance with relevant legislation or best
453 practices. Examples of information that the label should include:

- 454
- 455 • the name, address and telephone number of the sponsor, contract research
456 organization or investigator;
 - the statement: "For clinical research use only" or similar wording;

- 457 • a reference number indicative of the trial, site, investigator and sponsor, if not given
- 458 elsewhere;
- 459 • a batch or code number;
- 460 • the trial subject, patient identification number and /or a treatment code;
- 461 • a reference to the directions or instructions for use;
- 462 • information on storage conditions;
- 463 • an expiry date, use-by date or re-test date (month and year) or similar where
- 464 appropriate;
- 465 • a dosage form and route of administration;
- 466 • whether for single or multiple use;
- 467 • the quantity of dosage units and, in the case of open trials, the name/identifier and
- 468 strength/potency; and
- 469 • the statement: "Keep out of reach of children".

470

471 7.19. Additional information may be displayed in accordance with the order (e.g. treatment period,
472 standard warnings).

473

474 7.20. When necessary for blinding purposes, the batch number may be provided separately (*see also*
475 *"Blinding operations"*).

476

477 7.21. A copy or electronic record of each type of label should be kept in the batch packaging record.

478

479 7.22. The address and telephone number of the main contact for information on the product, clinical
480 trial and for emergency unblinding need not appear on the label where the subject has been
481 given a leaflet or card which provides these details and who has been instructed to keep this in
482 their possession at all times.

483

484 7.23. Particulars should appear in the official language(s) of the country in which the investigational
485 medicinal product is to be used. This may be provided electronically.

486

487 7.24. Where all the required information cannot be displayed on primary packaging, secondary
488 packaging should be provided bearing a label with those particulars. The primary packaging
489 should nevertheless contain information such as the name of sponsor, contract research

490 organization or investigator; route of administration; batch and/or code number; trial
491 reference code and the trial subject identification number or treatment code. Where required
492 such as in open label trials, the product name and strength of the product should be displayed.

493

494 7.25. Symbols or pictograms may also be used or included to clarify certain information. Warnings
495 and/or handling instructions may be displayed.

496

497 7.26. If it becomes necessary to change the use-by date, an additional label should be affixed to the
498 investigational medicinal product. This additional label should state the new use-by date and
499 repeat the batch number. The original batch number should remain visible. This labelling
500 activity should be performed in accordance with GMP principles, standard operating
501 procedures and should be checked by a second person. This additional labelling should be
502 recorded in both the trial documentation and in the batch records.

503

504 *Batch manufacturing, packaging and testing records*

505

506 7.27. Processing, packaging and testing records should be kept in sufficient detail for the sequence
507 of operations to be accurately traced.

508

509 *Coding (or randomization) systems*

510

511 7.28. Procedures should be established for the generation, security, distribution, handling and
512 retention of any randomization code used in packaging investigational products and code-
513 break mechanisms. The appropriate records should be maintained.

514

515 7.29. The coding system must permit the determination of the identity of the actual treatment
516 product received by individual subjects, without delay, in an emergency situation.

517

518 **8. Premises**

519

520 8.1. Premises, where investigational products are manufactured, should be located, designed,
521 constructed and maintained to suit the operations to be carried out.

522

- 523 8.2. The layout and design of premises should aim to minimize the risk of errors and mix-ups and permit
524 effective cleaning and maintenance in order to avoid contamination, cross-contamination and, in
525 general, any adverse effect on the quality of the products.
526
- 527 8.3. Attention should be paid to line clearance in order to avoid mix-ups.
528
- 529 8.4. Validated or verified cleaning procedures, as appropriate, should be followed in order to
530 prevent cross-contamination. Since the characteristics and toxicity of some investigational
531 materials may not be fully known, cleaning is of particular importance to avoid cross-
532 contamination. The visual inspection after cleaning, sampling and test procedures should
533 be appropriate and the acceptance limits applied should be scientifically justifiable.
534
- 535 8.5. Where identified through risk assessment, campaign production should be considered. In
536 other cases based on risk, dedicated and self-contained facilities should be used.
537

538 **9. Equipment and utilities**

- 539
- 540 9.1. Equipment and utilities should be selected, located, constructed and maintained to suit the
541 operations to be carried out.
542
- 543 9.2. The layout, design, installation and use of equipment and utilities should aim to minimize the
544 risk of errors and permit effective cleaning and maintenance in order to avoid cross-
545 contamination, a build-up of dust or dirt and, in general, any adverse effect on the quality of
546 products.
547
- 548 9.3. Computerized systems should be validated. The extent of validation should be based on risk
549 assessment (8).
550
551
552
553
554

555 **10. Materials**

556

557 *Starting materials*

558

559 10.1. The consistency of the production of investigational products may be influenced by the
560 quality of the starting materials. Their physical, chemical and, when appropriate,
561 microbiological properties should therefore be defined, documented in their specifications,
562 and controlled.

563

564 10.2. Existing compendial standards, when available, should be used.

565

566 10.3. Specifications for active ingredients and excipients should be as comprehensive as possible,
567 given the current state of knowledge.

568

569 10.4. Specifications for both active ingredients and excipients should be reassessed and updated
570 when required.

571 10.5. In addition to the specifications, detailed information on the active ingredients, excipients and
572 packaging materials should be available. This includes materials from animal origin.

573

574 *Chemical and biological reference standards for analytical purposes*

575

576 10.6. Reference standards (WHO or national standards) should be used, if available. Otherwise, the
577 reference substance(s) for the active ingredient(s) should be prepared, tested and authorized
578 for use as reference material(s) by the producer of the investigational pharmaceutical product,
579 or by the producer of the active ingredient(s) used in the manufacture of that product (9).

580

581 *Principles applicable to reference products for clinical trials*

582

583 10.7. In a study where an investigational product is being compared to a marketed product, the
584 integrity and quality of the reference (final dosage form, packaging materials, storage
585 conditions, etc.) should be ensured.

586

587 10.8. If significant changes are to be made in the product, data should be available (e.g. on

588 stability, comparative dissolution) that demonstrate that these changes do not influence the
589 original quality characteristics of the product.

590

591 **11. Production**

592

593 11.1. Products intended for use in clinical trials should be manufactured in accordance with the
594 requirements of this guideline, and where required by national legislation, in licensed
595 facilities. Manufacturing operations should be controlled as appropriate to the phase of
596 development and scale of manufacture.

597

598 11.2. Facilities, as listed below, should be subject to all GMP requirements for pharmaceutical
599 products;

- 600 • a large-scale production line assembled to manufacture materials in larger batches
601 (e.g. for late Phase III trials and first commercial batches);
- 602 • sterile product manufacturing; and
- 603 • the normal production line used for commercial batches and sometimes for the
604 production of investigational products if the number of, for example, ordered
605 ampoules, tablets or other dosage forms, is large enough.

606

607 11.3. Where activities are outsourced to contract facilities and the product(s) to be manufactured
608 or controlled are intended for use in clinical trials, the contract must then clearly state,
609 inter alia, the responsibilities of each party, compliance with this guideline and WHO GMP
610 (5). Close cooperation between the contracting parties is essential.

611

612 *Manufacturing operations*

613

614 11.4. As process validation may not always be complete during the development phase of
615 products, provisional quality attributes, process parameters and in-process controls should
616 be identified, based on risk management principles and experience with the products or
617 analogous products.

618

619 11.5. The necessary processing instructions should be identified and may be adapted based on

620 the experience gained in production.

621

622 11.6. Where processes such as mixing have not been validated, additional quality control testing may
623 be necessary.

624

625 11.7. For sterile investigational products, the sterility assurance should be no less than for
626 commercial products (*see GMP for sterile products (10)*).

627

628 *Packaging and labelling*

629

630 11.8. The packaging and labelling of investigational products are likely to be more complex and more
631 liable to errors (which are also harder to detect) when "blinded" labels are used than for
632 commercial products. Supervisory procedures such as label reconciliation, line clearance, and
633 other controls, including independent checks by quality unit personnel, should be intensified
634 accordingly.

635

636 11.9. The packaging must ensure that the investigational product remains in good condition during
637 transport and storage. Any opening of, or tampering with, the outer packaging during transport
638 should be readily discernible.

639

640 *Blinding operations*

641

642 11.10. In the preparation of "blinded" products, the blind should be maintained until it is required to
643 allow for the identification of the "blinded" product. The label expiry date should be assigned
644 to ensure that the 'blind' is not broken.

645

646 11.11. A coding system should be introduced to permit the proper identification of "blinded"
647 products. The code, together with the randomization list, must permit the proper identification
648 of the product, including any necessary traceability to the codes and batch number of the
649 product before the blinding operation.

650

651 11.12. Controls should be applied to verify the similarity in appearance and other physical
652 characteristics such as the odour of "blinded" investigational products. Maintenance of

653 blinding during the study should be ensured and verification of effectiveness of blinding should
654 be performed and recorded.

655

656 **12. Quality unit (including quality control)**

657

658 12.1. Quality control should cover, for example, the sampling and testing of materials and products.
659 The analytical procedures should be suitable for their intended purpose, ensuring that
660 materials and products are not released for use or supply until their quality has been judged to
661 be compliant with the specifications.

662

663 12.2. Each batch of product should be tested in accordance with the specifications included in the
664 Product Specification File and should meet its acceptance criteria.

665

666 12.3. Bulk product release should cover all relevant factors including production conditions, the
667 results of in-process testing, a review of manufacturing documentation and compliance with
668 the Product Specification File and the order. Finished product release should cover, in addition
669 to the bulk product assessment, all relevant factors including packaging conditions, the results
670 of in-process testing, a review of packaging documentation and compliance with the Product
671 Specification File and the order.

672

673 12.4. Reference and retention (control) samples of each batch of product should be retained.

674

675 12.5. Samples should be retained in the primary container used for the study or in a suitable
676 bulk container for at least two years after the termination or completion of the clinical
677 trial.

678

679 12.6. Retention samples should be kept until the clinical report has been submitted to the regulatory
680 authorities or at least two years after the termination or completion of the relevant clinical
681 trial, whichever is longest. This is in order to enable the confirmation of product identity in the
682 event of, and as part of an investigation into, inconsistent trial results.

683

684 12.7. The storage location of reference and retention samples should be defined in a technical
685 agreement between the sponsor and manufacturer(s) and should allow for timely access by

686 the competent authorities.

687

688 12.8. The reference sample should be of sufficient size to permit the carrying out on, at least, two
689 occasions of the full analytical controls on the batch in accordance with the Investigational
690 Product dossier submitted for authorization in order to conduct the clinical trial.

691

692 12.9. Where data and information are stored as electronic records, such systems should comply with
693 the requirements of *WHO guidelines for computerized systems (8)*.

694

695 12.10. The release of a batch of an investigational product should only occur after the designated
696 responsible person and sponsor, as required, have certified that the product meets the relevant
697 requirements. These requirements include the assessment of, as appropriate:

698 • batch records, including control reports, in-process test reports, changes, deviations
699 and release reports demonstrating compliance with the product specification file, the
700 order, and randomization code;

701 • production conditions;

702 • the qualification status of facilities, validation status of processes and methods, as
703 appropriate;

704 • the examination of finished packs;

705 • where relevant, the results of any analyses or tests performed after importation;

706 • stability reports;

707 • the source and verification of conditions of storage and shipment;

708 • audit reports concerning the quality system of the manufacturer, where applicable;

709 • documents certifying that the manufacturer is authorized to manufacture
710 investigational medicinal products or comparators for export by the appropriate
711 authorities in the country of export; and

712 • where relevant, regulatory requirements for marketing authorization, GMP standards
713 applicable and any official verification of GMP compliance.

714

715 *Note:* The relevance of the above elements is affected by the country of origin of the product,
716 the manufacturer and the marketed status of the product.

717

718 **13. Qualification and validation**

719

720 13.1. The extent of qualification and validation may be different to that necessary for routine
721 commercial production operations.

722

723 13.2. The scope of qualification and validation required should be determined based on risk
724 assessment.

725

726 13.3. For sterile products, there should be no reduction in the degree of validation of sterilizing
727 equipment required. Validation of aseptic processes presents special problems when the batch
728 size is small due to the low number of units filled for a validation exercise. Filling and sealing,
729 which is often done by hand, can compromise the maintenance of sterility. Enhanced
730 attention should be given to operator training and the qualification of their aseptic technique.
731 Greater attention should also be given to environmental monitoring.

732

733 **14. Complaints**

734

735 14.1. There should be a written procedure describing the managing of complaints.

736

737 14.2. Any complaint concerning a product defect should be recorded with all the original details and
738 thoroughly investigated.

739

740 14.3. Where necessary, appropriate follow-up action, possibly including product recall, should be
741 taken after investigation and evaluation of the complaint.

742

743 14.4. All decisions made and measures taken as a result of a complaint should be recorded.

744

745 14.5. The competent authorities should be informed if a manufacturer is considering action following
746 the identification of serious quality problems with a product that may be impacting trial
747 subjects or patients.

748

749 14.6. The conclusions of the investigations carried out in response to a complaint should be

750 discussed between the manufacturer and the sponsor (if different) or between the persons
751 responsible for manufacture and those responsible for the relevant clinical trial in order to
752 assess any potential impact on the trial and on the product development, in order to
753 determine the cause, and to take any necessary corrective action.
754

755 **15. Recalls**

756
757 15.1. There should be a written procedure describing the managing of a recall of investigational
758 products.

759
760 15.2. Recall procedures should be understood by the sponsor, investigator and monitor, in
761 addition to the person(s) responsible for recalls.

762
763 15.3. The recall of a product should be documented and inventory records should be kept.

764
765 15.4. The recall process should be tested routinely and the results of mock recall should be recorded
766 to demonstrate effectiveness.
767

768 **16. Returns**

769
770 16.1. Investigational products should be returned under agreed conditions defined by the
771 sponsor, specified in written procedures and approved by authorized staff members.
772

773 16.2. Returned investigational products should be clearly identified and stored in a dedicated
774 area in a controlled manner.
775

776 16.3. Inventory records of returned products should be kept.
777

778 **17. Shipping**

779
780 17.1. The shipping of investigational products should be carried out in accordance with written

781 procedures laid down in the protocol or shipping order given by the sponsor.

782

783 17.2. Shipping studies should be performed to establish acceptable shipping conditions, including
784 temperature and light protection, based on product attributes. If required, a temperature
785 monitor should be situated adjacent to the product, and the product shipment should be
786 packaged appropriately to ensure that it will reach its destination intact and maintain the
787 appropriate temperature profile during that time.

788

789 17.3. A shipment is sent to an investigator after following the defined release procedures, for
790 example, quality control, certification and authorization by the sponsor and responsible
791 person, as appropriate. Releases should be recorded.

792

793 17.4. The sponsor should ensure that the shipment will be received and acknowledged by the
794 correct addressee as stated in the protocol.

795

796 17.5. A detailed inventory of the shipments made by the manufacturer should be maintained
797 and should make particular mention of the addressee's identification.

798

799 17.6. The transfer of investigational products from one trial site to another should be done in
800 exceptional cases only. Such transfers should be justifiable, documented and carried out in
801 accordance with a written procedure. Repackaging or relabelling should normally be done by
802 the manufacturer or by authorised personnel at a hospital, health centre or clinic that meet the
803 requirements. Records should be maintained and provide full traceability of the product, batch
804 and activities.

805

806 **18. Destruction**

807

808 18.1. The sponsor is responsible for the destruction of unused, partially used or returned
809 investigational products. These should normally not be destroyed by the manufacturer
810 without prior authorization by the sponsor.

811

812 18.2. Destruction operations should be carried out in accordance with written procedures and
813 environmental safety requirements.

814 18.3. The delivered, used and recovered quantities of a product should be recorded, reconciled and
815 verified by or on behalf of the sponsor for each trial site and each trial period. The destruction
816 should be carried out only after any discrepancies have been investigated, satisfactorily
817 explained and the reconciliation has been accepted.

818

819 18.4. Destruction operations should be recorded in such a manner that all operations are
820 accounted for. These records should be kept by the sponsor.

821

822 18.5. A Certificate of Destruction should be available.
